RESEARCH INTERESTS

I am an applied mathematician interested in the broad fields of machine learning, optimisation, inverse problems and data science, and their application to problems in science. My current focus is on algorithms used in cryogenic electron microscopy (cryo-EM), including both traditional iterative algorithms and approaches based on deep learning. Previously, I worked on algorithms for deconvolution with spatially varying point spread function arising in light-sheet microscopy and developed theory for the stability of the super-resolution problem with non-negative measures.
